

Biohazards for Housekeepers / Maintenance Meeting Kit

WHAT'S AT STAKE

Housekeepers and maintenance staff in the hospitality industry face various safety hazards, including biological hazards. These hazards can expose workers to infectious agents, increasing the risk of illness or injury. Housekeepers in hotels may encounter broken glassware, used hypodermic needles, contaminated waste, human excreta, mold, and microbial contaminants, putting them at risk of contracting infectious diseases like HIV and hepatitis. Additionally, hotel cleaners are regularly exposed to hazardous chemicals in cleaning products, which can cause skin irritation, respiratory diseases, and other health issues.

WHAT'S THE DANGER

Housekeepers and maintenance staff in the hospitality industry are on the front lines of hygiene, but their job comes with certain risks. They can encounter various biohazards throughout their workday.

Bloodborne pathogens are a serious concern. Discarded needles, syringes, or other sharp objects left behind by guests can pierce the skin and transmit illnesses like hepatitis B, C, or HIV. Even bodily fluids like blood, vomit, or feces due to illness or injury can harbor these pathogens.

Microscopic enemies like bacteria, viruses, and fungi can also cause infections. Housekeepers may unknowingly be exposed to influenza, the common cold, or even more serious illnesses like hepatitis or MRSA while cleaning guest rooms, especially in bathrooms or areas where someone has been sick. Contaminated surfaces, laundry, or improperly disposed of waste can harbor these microorganisms.

Mold and mildew, which thrive in damp environments like bathrooms or areas with leaking pipes, pose another risk. Exposure to mold spores can irritate the respiratory system and trigger allergies. Untreated mold growth can become a significant health hazard.

Finally, other bodily fluids like saliva, mucus, and urine may not seem as concerning as blood, but they can still harbor germs and pose a health risk, especially if they come into contact with mucous membranes like the eyes or mouth.

HOW TO PROTECT YOURSELF

Reducing risks for housekeepers and maintenance workers in the hospitality industry involves implementing proactive measures to mitigate potential hazards. Here are some strategies to reduce risks effectively:

1. Prioritize Personal Protective Equipment (PPE):

- **Invest in high-quality gear:** Provide a variety of gloves (latex, nitrile) for different tasks, ensure masks properly fit and filter airborne particles, and offer different eye protection options (goggles, face shields) depending on the cleaning scenario.

2. Implement Effective Cleaning and Disinfecting Protocols:

- **Develop clear guidelines:** Establish protocols for cleaning different types of rooms (standard rooms, high-touch areas, post-illness occupancy).
- **Focus on high-risk zones:** Pay special attention to disinfecting bathrooms, doorknobs, light switches, remote controls, and other frequently touched surfaces.
- **Maintain a color-coded system:** Use color-coded cleaning cloths or mops for different areas (e.g., red for bathrooms, yellow for common areas) to avoid cross-contamination.
- **Train on proper dilution:** Inaccurate dilution can render disinfectants ineffective. Train staff on measuring and mixing disinfectants for the appropriate concentration.

3. Sharps Safety: A Collaborative Effort

- **Equip housekeepers with sharps identification training:** Empower housekeepers to recognize discarded needles, syringes, or lancets and differentiate them from regular waste.
- **Provide designated sharps containers:** Strategically place puncture-resistant sharps containers in housekeeping carts and maintenance areas to encourage safe disposal.
- **Train maintenance staff on potential sharps hazards:** Maintenance personnel may encounter sharps while fixing furniture or repairing walls. Educate them to approach punctures or tears in mattresses, upholstery, or carpeting with caution and report any findings for safe removal.

4. Foster a Culture of Safe Waste Disposal:

- **Provide clear signage:** Label biohazard bins with clear instructions and universal biohazard symbols to avoid confusion.
- **Routinely check and replace bin liners:** Ensure liners are not overflowing to minimize the risk of spills and exposure.

ADDITIONAL TIPS

- Partner with healthcare providers to facilitate vaccinations against hepatitis B, influenza, and other hospitality-relevant illnesses for staff.
- Promote regular handwashing with soap and water, especially after handling potentially contaminated items or removing gloves.
- Develop a system for housekeepers and maintenance staff to report biohazard incidents (spills, sharps, suspicious stains) to supervisors immediately.
- Promptly address reported hazards to minimize exposure risks for staff and guests.

FINAL WORD

A focus on preventative measures fosters a culture of safety

within the hospitality establishment. This benefits not only the staff but also ensures a clean and healthy environment for guests, allowing them to relax and enjoy their stay with peace of mind.
