

# Dry Ice – Safe Use and Handling Picture This

The worker is handling dry ice with bare hands, which can cause cold burns or frostbite due to the extreme temperature of dry ice ( $-78.5^{\circ}\text{C}$  /  $-109.3^{\circ}\text{F}$ ). His facial expression also suggests he is in pain or discomfort—likely from skin contact with the substance. This indicates unsafe handling of a hazardous material.

Always use insulated gloves or tongs when handling dry ice to

prevent skin injury. Work in well-ventilated areas to avoid dangerous CO<sub>2</sub> buildup. Dry ice is safe to use only when proper protective equipment and procedures are followed. Stay safe—protect your hands and your health.
