Schoolbus Safety – Distracted Driving Picture This

The image shows a school bus driver using a mobile phone while behind the wheel, a clear case of distracted driving. This behaviour is extremely dangerous, as it takes the driver’s attention away from the road, increasing the risk of an accident. Even a few seconds of distraction can lead to collisions, missed traffic signals, or failure to notice pedestrians and students. Given that school bus drivers are responsible for the safety of children, any distraction significantly compromises their ability to react to potential hazards.

To prevent distracted driving, school bus drivers should follow strict no-phone policies while operating the vehicle. Any necessary communication should be handled before departure or after parking in a designated safe area. Schools and transportation authorities should enforce zero-tolerance policies for mobile phone use and provide training on defensive driving and hazard awareness. Additionally, using hands-free communication systems for emergencies and keeping full attention on the road can help ensure a safer environment for students and other road users.
